

Appendix A

Interview questions

No.	Question	Client response
1.A	Why do you need a product to help you learn road theory and support your driving?	I have just recently acquired my provisional drivers licenses. And now I need to gain as much road experience as well as theory so I can take my driving exams as soon as possible. What I need the most since I have no driving experience is as much practice as possible and I believe a simulator would be perfect for that.
1.B	What is your current situation with available resources to tackle this problem?	Currently, I have no resources available as I have only recently acquired my provisional and I have not had any classes yet. I have been searching for an accurate driving simulator for a while but I only encounter racing games which are not very useful for real world experience.
2.A	What is the primary goal you want users to achieve with the product?	I want to be able to learn all of the theory prior to my theory test as well as as much driving experience as possible so I can get used to the roads, speeds, traffic lights, crossings and so on.
2.B	How crucial is mastering road theory in comparison to vehicle operation in order to achieve your goal?	I believe that I will be able to master vehicle operation quite easily with the practical lessons I will receive when I get my licence. However, what I will struggle the most is the theory because it is really content heavy and I believe I will not be able to memorize all of it easily, and so an external tool will be useful.
3.A	How realistic do you want the driving experience to be in terms of vehicle handling and physics?	I want the simulation to be very realistic so it can be as close to real life as possible, including pedestrians, road signs, and sensitivity equal to that of an actual car.
3.B	Should the product prioritise accessibility rather than realism? Why?	I would prefer if there was a good equal balance of both without compromising too much on the accessibility or realism.
4.A	What kind of road theory topics would you like to be covered in the simulator? Examples being; traffic signs, rules, regulations, fines, penalties, lanes etc.	I would really like it if it prioritised traffic signs as well as the rules. I believe those are the most important ones as well as the hardest ones.
4.B	Would you prefer such topics to be integrated together as a singular	I would like there to be modes where I could use the simulator to test my road signs knowledge or just my spatial awareness. On the other hand I would really

	simulated experience, or as separate learning modules or resources?	like it if I could also use the simulator with all the different modules all together to provide the most realistic experience for myself.
5.A	Does the product you envision to include a free-driving mode, structure formal experience, or a mix of both? How so?	A mix of both would be nice because I believe it would provide me with the best possible combination of free practice as well as a more realistic driving experience.
5.B	If structures how would you like lessons to be formatted (e.g. slideshow), else in a free-driving mode how would you like the theory to be incorporated in it?	I would like the lessons to have slides as well as free-driving mode. For theory slides and quizzes would be very useful(like in quizlet), other useful things would be the free driving mode. I believe this would help me a lot because I struggle a lot with spatial awareness and so free driving would allow me to develop that awareness.
6.A	What kind of customization options should be implemented? Vehicular, environmental?	I would like different cars to be implemented with different sensitivities so that I could practice driving more and less sensitive cars.
6.B	Should such customizations have an impact on driving experience or purely for aesthetic purposes?	Yes I think that it is very important for the cars to have an impact on the drivability as well as how fast and so it can go just so I know how it feels to drive different cars with different functionalities.
7.A	What types of environments should be implemented? Rural, Urban, Highways etc	I think that highways and roads are the most relevant ones, because that is where I will mostly be driving on.
7.B	Would you like such environments to be dynamic or static?	Yes this is very important to be, so that the experience is as realistic as possible. I would like it so that the environment was dynamic, in the sense that pedestrians and other cars on the road moved so that I can get a better idea of how real world driving is like.
8.A	Would you like the simulator to include road law exams or tests to test the understanding of users?	I would really enjoy both of these. I think that it's very important for me to be able to practise both the law exams as well as tests of understanding so I can make sure I have a solid understanding of driving both for my theory test as well as a better road understanding in general.
8.B	Should such tests be timed or allow users to go at their own pace?	I think that for me I learn better without timed exams because I do not learn well in timed situations and so I believe timed would not be ideal.
9.A	How important are visual graphics in comparison to educational value?	Both are very important, however I believe that the educational value is much more important than the visual components, after all the whole purpose of this tool is to learn both theory and practical aspects of driving.

9.B	Should the product prioritize performance optimization (for lower end systems) over high end graphics?	I think that a good balance of both is important, I would like the game to have good graphics so that it is as realistic as possible, another factor I would like is good performance optimization, and so a balance of both of them would be good.
10	How long should the lessons be? (user's pace, hours one big lesson)	I would like multiple small lessons, nothing over 20-30 minutes, this is so I can be able to do the lessons flexibly and remotely from anywhere pretty much, flexibility is very important for me.
11	What devices should be compatible with this product? (Steering wheels, windows, apple, controller, phone)	I would like it for the simulator to be as realistic as possible and so I would really enjoy it if a steering wheel was added so that the driving experience was as realistic as possible. When it comes to the driving lessons and theory I would like that to be run remotely on my laptop so I can access it everywhere any time.
